Hi Angela –

You're syntax is set up the way we ran it. Looks good.

Coreen

Subject: Re: Analysis confirmation

Sorry one question that may answer all of my others! - can you confirm whether you used ANOVA or regression? You mentioned regression over the phone, but output stats suggest a GLM factorial ANOVA was used. I have run this already so assuming this is correct all other questions are answered. I did however have two Affect factors (pos, neg), each at two levels.

GLM Sens_Friend Sens_SI Sens_Sad Sens_Rej BY Gender Task_length

/WSFACTOR=pos 2 Polynomial neg 2 Polynomial

/METHOD=SSTYPE(3)

/CRITERIA=ALPHA(.05)

/WSDESIGN=pos neg pos*neg

/DESIGN=Gender Task_length Gender*Task_length.

Hi again Coreen,

Thanks for the clarification of scores, we are now at the final analysis stage and I want to clarify we have the model correct.

DVs x 4

Sensitivity to Friendly (F)

Sensitivity to Sexual interest (SI)

Sensitivity to Sadness (Sad)

Sensitivity to Rejection (Rej)

Predictors x 3

Gender

Presentation time (between-subjects)

Affect* (within-subjects: two levels - pos/neg)

*Can you clarify exactly how you did this? You mention over the phone that you added an "affect" factor with two levels (pos, neg) and then for each they were two scores (F/SI; Sad/Rej). It is not clear to me how to run this in a single model. I have four continuous dvs that I need to mark as being different levels of a predictor factor (affect). Did you create another binary variable somehow (which seems difficult in SPSS given this is a within-subjects factor)?

Many thanks again for all of your help. It is very much appreciated.

Angie.
